

ENERGY PYRAMIDS

• Fox is "top predator/consumer" (like shark)

* heat energy is lost @ every level so there is less energy for the consumers at next level.

That's why food webs can't go for too many levels.

Run out of energy + mass.

Biomass = The mass of living organisms in an area
 Ecological pyramid = representation of energy, numbers or biomass in an ecosystem.

NOTE: primary = 1 secondary = 2 tertiary = 3
